

Belarusian debugging of EDFA800G

Overview

This is a simple command line utility for programming ARM-based MCUs through CMSIS-DAP SWD interface. It works on Linux, Mac OS X and Windows. It was tested with Atmel mEDBG- and EDBG-based bo.

Belarusian debugging of EDFA800G

Upon cracking open this second clone device, he found it was comprised of little more than a WCH CH552G microcontroller with an extremely simplistic circuit design of a 3.3V regulator it was ...

It's easy to use, connects to your computer through USB and will work with most ROMs available. XGecu's Xgpro program for Windows also lets you use this programmer to test most of the logic ICs ...

It was tested with Atmel mEDBG- and EDBG-based boards, Atmel-ICE, LPC-Link2, IBDAP and Free-DAP -based debuggers. Binary releases can be downloaded from here. Binary releases are not ...

It covers initial board setup and running a prebuilt disk image, hardware, and software applications development using the prebuilt image, and full custom hardware and software builds and ...

It was tested with Atmel mEDBG- and EDBG-based boards, Atmel-ICE, LPC-Link2, IBDAP and Free-DAP -based debuggers. Binary releases can be downloaded from here. Binary releases are not ...

There are many tools available to address 800G RS-FEC design issues. It is important to know which tools are useful for debugging various situations.

The -g option is used in the bitbake command to enable various debugging features, especially the task dependency visualization using .dot files. When used with the build command, it generates log files ...

I want to debug a design with partial reconfiguration modules using ILA/Chipscope. I've set up and instantiated an ILA core manually inside the reconfiguration partition and added the BSCAN ...

SmartDebug enables the debugging of designs by providing verification and troubleshooting features at the hardware level. It provides access to probe points, Non-Volatile Memory (NVM), fabric and fabric ...
