

Function of Security Access Switch

Overview

Secure Sockets Layer (SSL) and Transport Layer Security (TLS) provide remote web browser access (WebAgent) to the switch through authenticated transactions and encrypted paths between the switch and management station clients capable of SSL/TLS operation. Network switches serve as the building blocks of the network, as they facilitate the flow of data within Local Area Networks (LANs). Is that all?

No, there's more to it. This post analyzes the importance.
