

Torque Test of the Head Cabinet

Overview

Movement Test: The movement check, also referred to as the first movement torque test, is done by using a torque measuring tool to test a tightened threaded fastener (nut, bolt, or screw). Mark the tightened fastener and turn the torque testing tool clockwise to start. Search within the title, abstract, claims, or full patent document: You can restrict your search to a specific field using field names. A torque test is used to identify the reaction of an object under turning and twisting conditions. Wheel hub dynamometers apply realistic, road-like loads based on a vehicle dynamics model, allowing highly accurate and repeatable test. The thread converts the. from tiny 1 Nm to massive 5000 Nm.
