

Wavelength Division Multiplexing System Link Components

Overview

WDM systems are divided into three different wavelength patterns: normal (WDM), coarse (CWDM) and dense (DWDM). Normal WDM (sometimes called BWDM) uses the two normal wavelengths 1310 and 1550 nm on one fiber. Coarse WDM provides up to 16 channels across multiple transmission windows of silica fibers. Overview In, wavelength-division multiplexing (WDM) is a technology which a number of signals onto a single by using different (i.e., colors) of. A WDM system uses a at the to join the several signals together and a at the to split them apart. With the right type of fiber, it is possible to have a device that does both s.

Our goal is to design an 8-channel WDM system with a comb laser as the input, cascaded ring modulators to modulate and multiplex the signals, and cascaded ring resonators to demultiplex.

Key Components in a DWDM Link A working DWDM system involves more than just the multiplexer and demultiplexer at each end. Transponders sit at the edges of the system, converting ...
